

You already told us what you didn't understand.

English learners hit rewind dozens of times a day, and **no app records that tap**. Echo keeps the thirty seconds you replayed — no questions, no interruption — and hands them back tomorrow.

01 / AS IT HAPPENS	02 / SECONDS LATER	03 / THAT EVENING	04 / NEXT MORNING	05 / AFTER THAT
Catch the tap	Transcribe just this	Diagnose the break	Reveal in stages	Before he forgets
Back button, Control Center, lock screen — all count. Taps within 3 s are one signal.	Windowed ASR — not the whole episode. Saves cost, and saves waiting.	Linking, vocabulary, syntax, speed, culture, segmentation — one of six.	Clue → skeleton → full text. The mask keeps the sentence's shape.	Spaced repetition; every grade leaves a review log behind.

Why the rewind button is a good signal

- 3.06

ODDS RATIO

Learners who **spontaneously** noticed a vocabulary hole were 3.06× as likely to learn that word.
- 4.57

ODDS RATIO

Learners **prompted** to speak, and who noticed the gap that way: 4.57×.
- n.s.

BETWEEN THE TWO

The two groups **did not differ significantly** — forcing the action beats noticing on your own by nothing.

What does the work is **realising you have a gap** — not the action. Hitting rewind *is* that moment. So we never interrupt.

- 34–38%

VARIANCE EXPLAINED

Aural vocabulary + **lexical segmentation** explain this much of L2 listening scores. Miss one boundary, the sentence collapses.
- 0

RIVALS COLLECTING IT

No app collects *where a learner can't even find the word boundaries*. Reading apps never see it — text has no connected speech.

Noticing vocabulary holes aids incidental L2 word learning – Bilingualism: Lang. & Cognition · Field (2003), Promoting Perception: Lexical Segmentation in L2 Listening · Hulstijn & Laufer (2001), Involvement Load Hypothesis – Language Learning

Working today

- ✓ **End-to-end loop**, fully automatic — rewind to scheduled practice
- ✓ **Lock-screen rewinds count too** — pressed with the screen off
- ✓ **Two-tap selection** + a “**how many words?**” escape hatch
- ✓ **Difficulty bands 1–5** — measured and guessed are drawn differently

The four questions on your passport

- Q · What problem, and how far along?

Apps teach **their syllabus**, not the English you miss. The pipeline above **runs end to end** — so far only on me (N=1, week 5).
- Q · Who pays first, and why?

Non-native students and early-career professionals in the US — living in English, still missing half of it. **I am one of them.**
- Q · What do you want from Silicon Valley?

A **speech/ML co-founder**, and **ten people who'll use it seven days straight**.
- Q · Biggest milestone in three months?

Next-day return rate. Will he come back tomorrow to practise what he rewound today? That number decides whether this exists.

What's next

- Lock screen & Dynamic Island quiz w7**

Three choices on the lock screen. Tap one, the next appears — the app never opens.
- Situated reminders w8**

At the pharmacy door, we hand back the drug name you stalled on last week.
- Real-life mode, in your earbuds Q4**

Pinch your AirPods when you miss a real person. Same signal, off the podcast.

Looking for ten people who'll use it seven days straight.
